NOTE: This status report was compiled in the short time between the close of the survey period and the date of the Dove Regulations meeting. All data could not be checked completely in that time.

ABSTRACT

An index to the 1961 mourning dove breeding population was obtained by a call-count survey conducted throughout the United States. Trends in the breeding-population index were calculated for three management units and for hunting and nonhunting States within management units. Trends in the breeding-population indexes from 1960 to 1961 were as follows: Eastern Unit down 4 percent, Central Unit down 10 percent, and no change in the Western Unit. Long-term trends in the breeding indexes, however, are upward in the Central and Eastern Units. The index for the Western Unit is essentially unchanged from 1953. For the United States as a whole, the 1961 breeding-population index is down 7 percent from 1960 and is 30 percent above the 1953 level.

INTRODUCTION

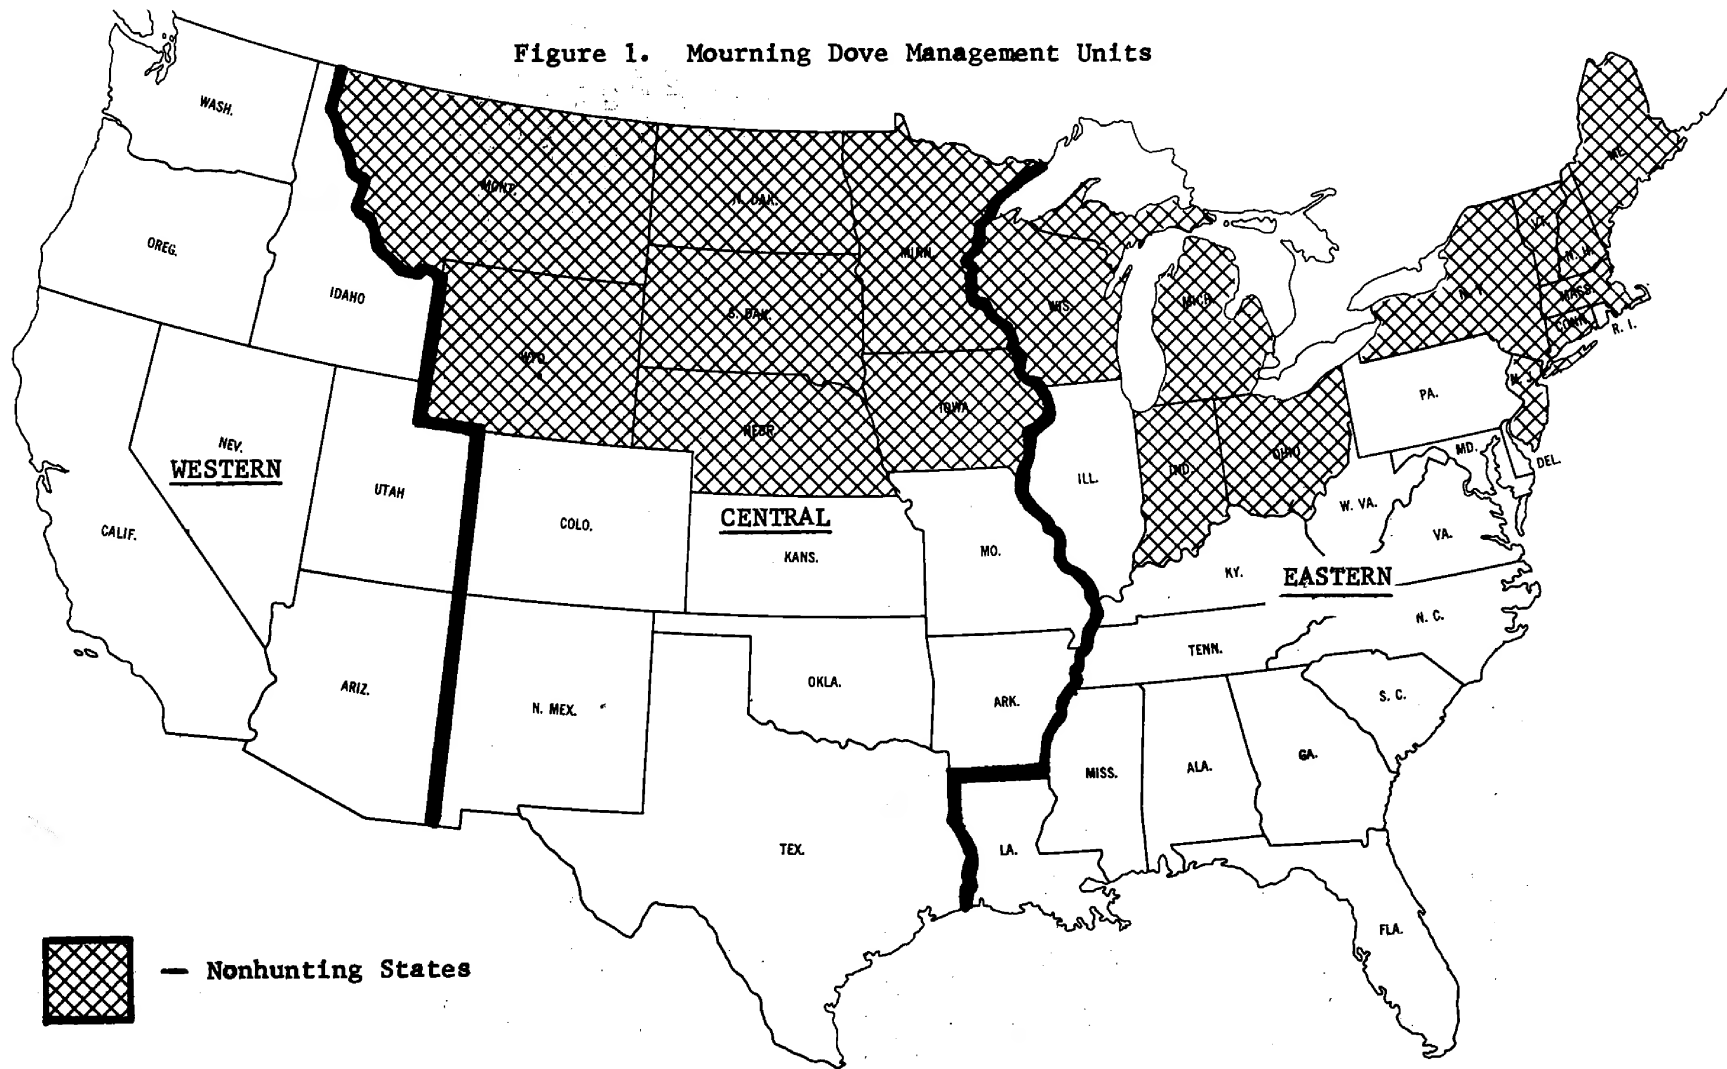

Prior to 1960, the annual status of the mourning dove population was reported in the Mourning Dove Newsletter. The Newsletter continues as a report on activities in mourning dove research and management on a national scale, but the annual report on status of the population, used chiefly for regulatory purposes, is published separately.

An annual survey of the breeding population of mourning doves by a system of call-count routes provides an index to the status of the population in the United States. Through the cooperation of State, Bureau, and independent observers, call-count routes were widely established by 1953. The hundreds of cooperators who participate in the call-count survey have contributed the data that form the basis for this report.

The call-count survey period is May 20 - June 10, a period during which dove calling activity is relatively stable, as indicated by intensive studies in eastern United States. Because hunting regulations must be published by a specified time prior to the hunting season, the Dove Regulations Committee meets late in June and population-status statistics must be summarized for consideration by the Committee. This status report serves that purpose. It also is distributed to all cooperators in the call-count survey and is available to interested organizations and individuals.

For several years prior to 1960, the Federal framework of mourning dove hunting regulations was established on the basis of eastern and western groups of States. Recent analysis of banding data indicates that there are three units of the mourning dove population in the United States that are largely independent of each other (Kiel, 1959). The criteria for independence are that a unit produces the doves that it harvests and does not produce doves that are harvested by other units. The Eastern, Central, and Western Management Units outlined in figure 1 best meet these criteria for management units on the basis of present information. Although additional banding data are needed to establish firmly the management-unit boundaries, the Federal framework of hunting regulations was established on the basis of three management units in 1960.

Figure 1. Mourning Dove Management Units

PROCEDURE

The Call-count Method

Call-count routes were established after field investigations in 1950-51 reported by Foote, Peters, McGowan, Kerley, Duvall, Robbins, and Wagner (1952). Doves heard calling and doves seen are recorded on a route 20 miles in length with listening stations one mile apart. Call counts begin one-half hour before sunrise and continue for two hours. A report on the call-count method and procedures for randomly selecting call-count routes has been published by Foote, Peters, and Finkner (1958). Five States - Arizona, California, Florida, Maryland, and Virginia - are reorganizing dove survey routes this year.

The call-count survey provides the only population index currently available. It has limitations and possible biases that require consideration and evaluation through further study. It is an index to the breeding population only and does not indicate production. This is an important limitation because a high percentage of the fall population is composed of young of the year. In calculating trends in the breeding-population index, doves heard calling has been a less variable index than doves seen. Additional research is needed to understand the relationship of doves heard calling to the actual population in various portions of the mourning dove breeding range. Several Cooperative Wildlife Research Units are beginning studies of the call-count census method this year.

Weighting Factors

To calculate trends in population indexes for units larger than one State, the adjusted figure of average doves heard calling per route for each State is multiplied by the estimated area of dove habitat in the State. Dove habitat area was estimated in the 1958 Mourning Dove Newsletter and is listed in table 1.

In calculating band-recovery rates for local, immature, and adult mourning doves on a management-unit basis, the breeding-population index for a State was divided by the number of doves banded in each age group to obtain a weighting factor for each banded bird (Kiel, 1959). Band-recovery rates on a State basis were calculated only for those States banding 100 or more doves in the age group of interest, and only those States were included in the calculation of weighted band-recovery rates for hunting and for nonhunting zones within a management unit (table 2). To obtain an average band-recovery rate for a management unit having a hunting and a nonhunting zone, recovery rates for the two zones were weighted by the ratio of the breeding indexes of the zones.

Long-term Trends

For the purpose of showing long-term trends in the breeding-population index of a State, a base year was selected, and annual percentage changes have been applied to the base figure (average doves heard calling per route) to give an adjusted figure which shows the true relation of indexes from year to year. The selection of a base figure is necessary because not all routes are censused each year. From a base year, average doves heard calling per route for each State has been adjusted annually according to the percentage change from the preceding year in counts on comparable routes. For example, the base year for Alabama is 1957 (table 3). In that year, the average doves heard calling per route was 21.1. In 1958, the percentage change from 1957 in counts on comparable routes was an increase of 12.8 percent, so the base figure of 21.1 was adjusted upward by 12.8 percent to a level of 23.8. In 1959, the percentage change from 1958 in counts on comparable routes was a decrease of 21.6 percent, so the 1958 adjusted figure or adjusted base was decreased by 21.6 percent, from 23.8 to 18.7. For the current year, 1961, the percentage change from the preceding year in counts on comparable routes was a decrease of 11.5 percent, which decreases the 1960 adjusted figure from 22.7 to its 1961 level of 20.1.

TRENDS IN THE BREEDING-POPULATION INDEX - 1961

Eastern Management Unit (fig. 1)

The breeding-population index for the Eastern Unit decreased 4 percent from the 1960 level (table 1). Figure 2 shows that the breeding index of the Eastern Unit has been increasing generally over the 7-year period prior to 1961. The slight decline in 1961 placed the population index 31 percent above the 1953 level.

In hunting States of the Eastern Unit, the breeding index decreased 6 percent from 1960 but remained 36 percent above the 1953 level (table 1 and fig. 3). In nonhunting States, the index increased 5 percent from 1960 to 1961 (table 1). The long-term trend of the breeding index in nonhunting States of the Eastern Unit is shown in figure 3 and indicates a relatively stable population in recent years. The 1961 index, however, was 18 percent above 1953.

Central Management Unit (fig. 1)

The breeding-population index for the Central Unit decreased 10 percent from the 1960 level (table 1). Figure 2 shows that for 6 years during an 8-year span the breeding index of the Central Unit increased, and the downward trend in 1961 left the index 52 percent above the 1953 level.

**Figure 2. Trends in Breeding-population Indexes
by Management Units, 1953-1961**

Figure 3. A Comparison of Trends in Breeding-population Indexes for Hunting and Nonhunting States within Management Units.

In hunting States of the Central Unit, the breeding index decreased 16 percent compared to 1960 but remained 40 percent above the 1953 level (table 1 and fig. 3). In nonhunting States, the index declined 1 percent between 1960 and 1961 (table 1). The long-term trend of the breeding index in nonhunting States of the Central Unit is shown in figure 3 and roughly follows the trend in hunting States. The 1961 index was 69 percent above the 1953 level.

Western Management Unit (fig. 1)

The breeding-population index for the Western Unit showed no change from the 1960 level (table 1). Figure 2 shows that the breeding index of the Western Unit has fluctuated moderately over an 8-year period and in 1961 was 5 percent below the 1953 level.

Discussion of Population-index Trends

Indexes to mourning dove breeding populations in the three management units showed small changes from the 1960 level. In recognition of the many variables in the call-count survey, changes of this magnitude must be considered insignificant. Long-term trends in the breeding indexes, however, are upward in the Central and Eastern Units. The index for the Western Unit is essentially unchanged from the 1953 level.

Over an 8-year period, hunting and nonhunting States in the Central Unit showed substantial increases in breeding indexes, 40 percent for the hunting States and 69 percent for the nonhunting States. Eastern Unit hunting States showed a population-index increase (36 percent) twice as great as the nonhunting States (18 percent) over the same 8-year period. The greater increase in the population index in hunting States occurred despite generally higher band-recovery rates from doves banded during the breeding season in hunting States than from those banded in nonhunting States (table 2).

For the United States as a whole, the 1961 breeding-population index was 7 percent below the 1960 level. The long-term trend has been generally upward since 1953 and the index is now 30 percent above the 1953 level.

* From a base year, average doves heard calling per route for each State has been adjusted annually according to the percentage change from the preceding year in counts on comparable routes. The index, expressed in thousands, is the product of the adjusted average doves heard per route and the estimated area of dove habitat.

** The area of dove habitat has not been estimated for Maine, New Hampshire, Rhode Island, and Vermont.

Table 2. Comparative Weighted Band-recovery Rates on a Management-unit Basis.

		Band-recovery Rate (percent)		
		Adults	Immatures	Locals
Eastern Management Unit	Hunting States	3.9	5.7	4.2
	Nonhunting States	1.1	1.1	1.7
	Average*	3.1	4.4	3.5
Central Management Unit	Hunting States	1.4	2.6	2.3
	Nonhunting States	1.9	0.8	0.9
	Average*	1.6	1.9	1.7
Western Management Unit	Hunting States	2.8	3.6	2.0

*The averages are weighted on the basis of the breeding indexes of the hunting and nonhunting zones of the management units (Kiel, 1959).

Table 3. Trends in the Breeding-population Index, 1953-61.

The first figure listed for each State by years is the adjusted average doves heard calling per route. The method of adjustment is described in the text. The base year for adjustments was 1956 or 1957. States for which 1957 was the base year are those that reorganized call-count routes in that year. These States are Alabama, Georgia, Kentucky, Mississippi, North Carolina, South Carolina, and Tennessee.

The second figure for each State is the breeding-population index. The index, expressed in thousands, is the product of the adjusted average doves heard per route and the estimated area of dove habitat. (Habitat area is given in table 1.)

PERCENTAGE

CHANGE +3.6 +10.2 +3.8 +8.8 -7.3 +10.8 +5.9 -6.6

* The 1953 index is incomplete because Colorado, Utah, and Wyoming did not conduct call-count surveys until 1954. The percentage change from 1953 to 1954 is based on comparable data only.

** Maine, New Hampshire, Rhode Island, and Vermont first established call-count routes in 1959. No estimate has been made of the square miles of dove habitat in these States.

Table 4. Summary of Call-count Routes by States.

Includes all routes run in 1961 but only comparable routes for 1960.
